
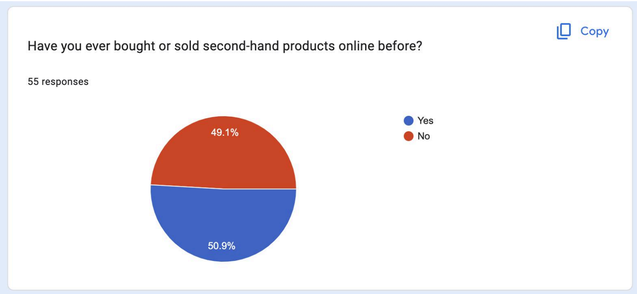
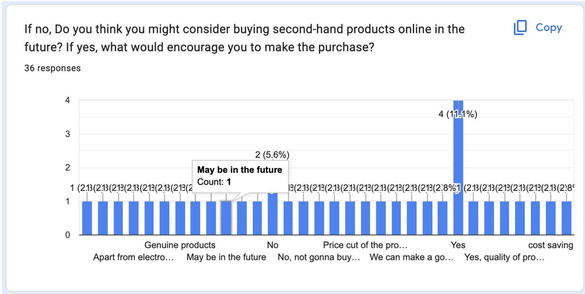
As per the brainstorm, the possible target audience would be around early college joinee till retirement. The application is Rebel based to provide the community with the unusual way of buying and selling and getting used to the second hand products.

From the results with major considering the 20's and overall report of 18 to 55, the age group of 20's are mostly willing to buy if the product is reliable and required.

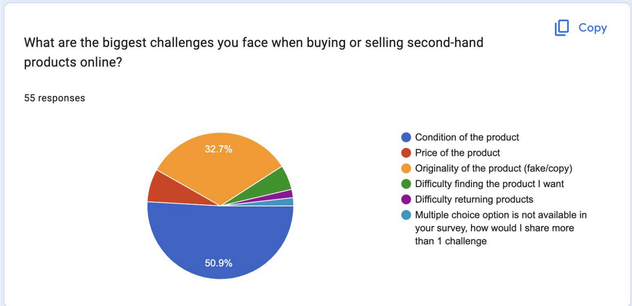




As again, being a rebel product. The initial sales of the business will be considered low.
the marketing is to be tough until the sustainability and eco-friendly practises are made aware to the community.

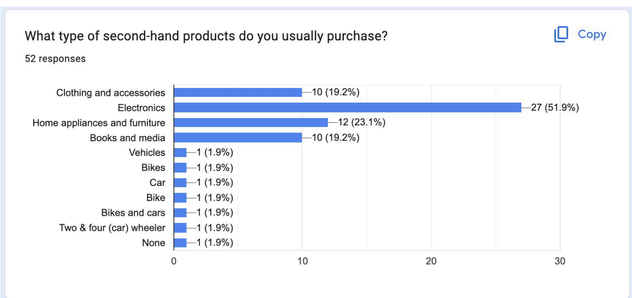
From the results, 50.9% people are willing to buy and considering the second question for people who mentioned **No** as for the first one, Few mentioned they **wouldn't buy no matter what**.

Analysis here is, The potential target audience could be hard on considering the biased of the second hand products. It would be efficient if we can convert them but if the customer is non experimental it would take a longer run to convince them.



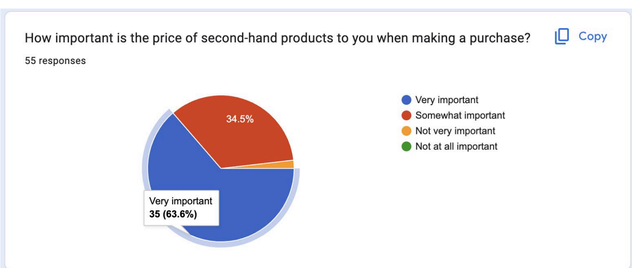
The users main concern in the product condition and the originality when they buy it online. There are multiple cases where even first hand selling websites had issues on this. Its reasonable to consider this as one of the main pain points of the user being a user myself.

From the results, there are multiple pain points for the users in these applications (blue), however when asked one particular pain points, the condition and originality plays a vital role in our application. Apart from it the pricing and the wide range of products would be the next factors. On focusing on our goals aligning with these pain points, its possible for the application to be quite unique and be successful easily.



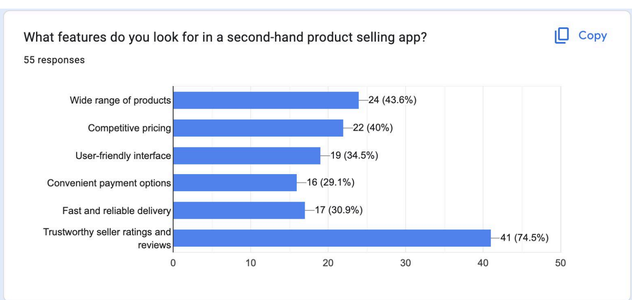
Considering all the inputs, and the growth plan of **ThriftHaven**. It is again favourable for the application as initially entering the business with clothing and books in mind as it can be provided at a very affordable rates. The market and range of products can be added on to the business once the application has a stable market. Vehicles and cars are considering to be one a most inconsistent as per secondary research and hence that would be the least of the interest for ThriftHaven.

From the Results, Home appliances and furnitures can be considering in the initial options as they have a potential market in these age categories. Apart from it, as per the current goal the clothing and accessories, & Books and media aligns with the current target of the application.



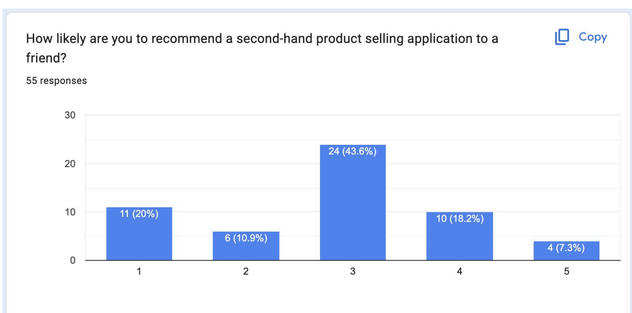
As from the results, this favours our concept and USP as every users major concern is the price and they want this at a better price than their competitors.

Providing products are a lower cost, which be beneficial for the business as this is what every user wants as per the data. The not very important users are willing to go for the second hand products as per the survey.

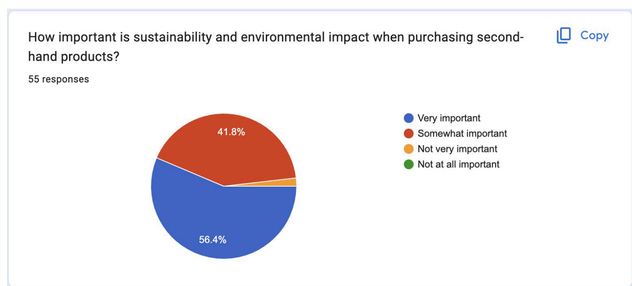


Trustworthy is main concern of the user and wide range of products is also one major aspect. on the third the USP of **Thrifthaven** "competitive pricing" is positioned which is again favourable for the application.

From the results, The options related to applications are less of a concern when the user navigates or paying. Rather they require trustworthy products on a wide range with being cost efficient.



The questions are asked in a wrong manner as left is most likely and right side is less likely and people might have been confused and considering 3 as major input field it is possible for the users to recommend if the application servers right.



Somewhat important and **not very important** mentions that there are people who doesn't understand Sustainability and environmental impact of reusing old products. It could also be considered that people might have blindly mentioned very important as specifically asked.

From the results, The application's marketing role could be at stake as people are unaware of the impacts from reusing which is one the major selling points for the business. Marketing and the application should process with considering eco-friendly advertisied.

Overall, the survey findings suggest that the majority of respondents are interested in using second-hand clothing and book selling applications. The most common reasons for using these applications are to save money and to be more sustainable. The biggest pain points for respondents are difficulty finding items that they are interested in and difficulty finding items in good condition. The biggest suggestions for improvement are to have more items available and to have better quality control.
